

iManage WorkPortal™

Create Your Personalized Gateway to Enterprisewide Content

iManage is the leading provider of collaborative content management software.

The iManage WorkPortal application provides each member of your extended enterprise a secure consolidated view of business content from multiple sources and applications, including the iManage repository. By aggregating information from enterprise systems, business intelligence, news feeds and Web content, iManage WorkPortal provides quick and easy access to all relevant content and its context—from a single portal page. This saves time, increases overall productivity and enables more informed decisions.

View and take action on all relevant content in the right context – directly from your portal page.

Growth in Portals

A growing number of businesses are deploying corporate portals to organize and deliver up-to-date business content to employee desktops around the world. Whether organized by department, project team, best practice or application, portals are an effective way to quickly extract relevant content from many different data sources. Industry analysts estimate that roughly half of all businesses in the U.S. deploy an Intranet portal today.

iManage WorkPortal

View and Take Action on Critical Business Content From Your Portal Page

iManage WorkPortal provides a consolidated view of content stored in the iManage repository and other

corporate enterprise systems—from a single portal page. And unlike stand-alone portals that allow you to only view enterprise data, iManage WorkPortal enables users to both view *and* take action on content directly from this portal page.

For example, WorkPortal users can securely access critical business documents, share task lists with project teams and discuss and collaborate on relevant documents directly from the portal page. Moreover, this capability can be extended to partners, suppliers and customers via your Extranet and a simple Web-based browser.

WorkPortal's one-stop access to all relevant content in the right context empowers each member of your team to make more informed decisions. Employees save valuable time and money by leveraging existing data sources, while cutting costs for express mail and travel.

Key Features of iManage Portal Include:

Tight Integration With Document Management:

The iManage WorkPortal application builds on the iManage foundation of full-featured document management and robust search capabilities to centrally manage, access and update enterprisewide content—all without leaving the portal page.

Contextual View of Pertinent Business Content:

The iManage WorkPortal application provides context to information by aggregating structured and unstructured data from multiple sources and then accurately and quickly summarizing the information on a single portal page.

For example, a portal page for a project can contain the documents, tasks, events and business intelligence reports related to that project. With iManage WorkPortal you can conduct sophisticated concept searches across all repositories and deliver a personalized view of all pertinent information to your portal page.

Global Collaboration: By combining functionality from iManage WorkTeam, you can transform your portal into a project collaboration center to share and collaborate on relevant project content with teams both within and outside the enterprise. When seamlessly integrated with the iManage WorkDocs and WorkTeam applications in the iManage WorkSite, WorkPortal fosters a powerful, highly collaborative document and knowledge management environment.

Data Aggregation Through Connectors: WorkPortal's powerful development framework extracts data from other enterprise systems, including ERP, CRM and legacy applications, through a flexible connector architecture that allows you to rapidly build and deploy your own connectors. iManage WorkPortal supports more than 250 connectors out-of-the-box to aggregate news, popular Web sites, e-mail systems, accounting systems, database and enterprise applications.

Ease of Administration: A simple Web-based interface allows administrators to easily create default home pages, assign user home pages, modify site navigation or create new users and groups.

Robust Server Architecture

Delivers Security, Performance and Low Cost of Ownership

All WorkSite applications are powered by an open, secure, enterprise-class platform that scales to handle millions of documents and ten of thousands of geographically

distributed users. Built on a highly flexible, distributed, multitier architecture, WorkSite supports distributed repositories, built-in fault tolerance, load balancing and clustering. Comprehensive administration tools integrate with LDAP, NDS and ADS servers and make it easy to administer iManage WorkSite.

WorkSite can be deployed out-of-the-box in weeks—or you can customize, extend it and create new applications with the iManage Software Development Kit. Quick to deploy and easy to maintain, WorkSite lowers total cost of ownership and generates a rapid return on investment.

Professional Services, Technical and Partner Support

All iManage products are backed by professional services, technical support, training services and a global network of certified partners to help you successfully implement and extend your iManage WorkSite.

System Requirements for iManage WorkTeam

- Internet Explorer 5.x, 6.x or Netscape 4.7
- Microsoft® Windows® 95, 98, Millennium, NT® 4.0, 2000 or XP
